

DESIGNING WITH ACOUSTICS

PRESENTED BY

Matt Lihou
Architectural Consultant, Atkar Group

How do I get the design I want and still have the appropriate acoustic control to suit the room? Atkar Group are often asked this question and know firsthand that effective acoustic control can be more than basic ceiling tiles or a fabric panel on the wall. This presentation provides an overview of acoustics and will help you to identify what design aspects can affect acoustic performance and what acoustic considerations you need to consider in different spaces. As a leading manufacturer of acoustic and architectural linings, Atkar Group has an unrivalled heritage working directly with the design and construction industry for over 70 years. Our role is to help our clients transform their design vision into beautiful, innovative and effective architectural acoustic solutions that meet the requirements of their project specification.

Wednesday 28 November 2018

5.00pm Arrival for 5.30pm Start

33 Broadway, Nedlands

Members FREE Non Members \$45.00

- Recognise key acoustic definitions and their effect on your design
- Differentiate between Sound Absorption and Sound Transmission Loss
- Recognise the importance of reverberation time and the impact of sound absorption
- Identify what design aspects may affect acoustic performance
- Interpret acoustic data certificates
- Identify what current fire requirements can influence acoustic design
